

Does your front and rear washer come on together ? ..... does it just dribble out ? ..... heres a 5 minute , \$5 fix

Heres the 'washer valve' ..... remove it and pull it apart .... you will also need a \$5 bicycle puncture repair kit (the one pictured is from KMart)

Clean it out watching out for the spring and o ring ..... cut new rubbers from the repair kit to stick on both sides of the metal disc and put it all back together and re attach the hoses that I know you remembered their correct spots from before.

I now have a gusher at the rear and front washers and only when the appropriate one is operated at the stalk ..... will it last ? .... who knows !
